Health & Safety Risks

Replay Maintenance is a UK wide specialist maintenance company with over 25 years experience in the synthetic sports surface industry.

Our customer lead service using highly experienced operatives and innovative machines and procedures to maintain all types of synthetic surfaces.

Maintaining sports surfaces

Revive® Maintenance will:

- Optimise playing performance and player comfort
- Maximise availability, revenues, life expectancy and original capital investment
- Minimise life cycle costs
- Minimise Health and Safety risks

Revive Maintenance uses a specifically developed single operator, ride on machine with inter-changeable brush and decompaction heads for different types of synthetic surface such as infilled carpets, water based carpets and polymeric.

On infilled surfaces, the rotary brushes penetrate deeper into the infill than static brushes, breaking up the contamination crust and removing it with a powerful vacuum filter system for disposal off site.

The sand or rubber infill particles are filtered and then dropped back onto the surface for redistribution and regulating using the static brush head and finishing drag mat.

On water based carpets or polymeric surfaces contra-rotating brushes combined with an interchangeable wet filter allow surface detritus to be removed even in the wet.

Rotary brushing with turbine vacuum filter system

Revive® Maintenance

While the low maintenance requirements of modern synthetic sports surfaces have always been one of their main selling points it has become clear that **planned, proactive maintenance regimes** are the best way to **maximise performance** and the **original investment** in the surface.

Synthetic surface manufacturers and installers recommend basic regular in-house maintenance augmented by specialist procedures such as our Revive Maintenance.

Revive Maintenance uses state of the art machines to remove contaminants from synthetic surfaces – reducing compaction, enhancing porosity and maintaining play characteristics.
