

The **REPLAY REJUVENATION** process restores sand-filled & sand-dressed tennis courts to an 'as new' condition, in terms of safety, performance & drainage. This substantially increases the playing life of the surface for a fraction of the cost of a new carpet.

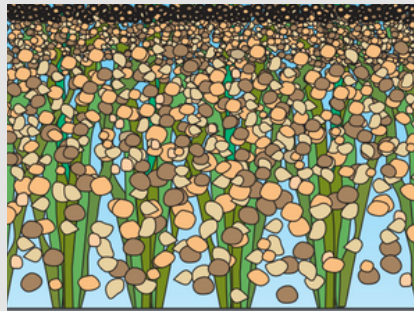

Surfaces become **compact**, holding water making them **slippery** with **silt** coming up after rain, this can be a **hazard** for users.

Our **unique machinery** can **remove** all the **contamination** from the carpet to **restore** its **drainage** to "as new".

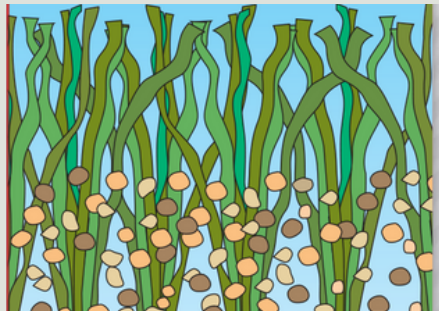

We then apply **new silica sports sand** to the surface as required, which can take a few weeks to bed in through play & matting.

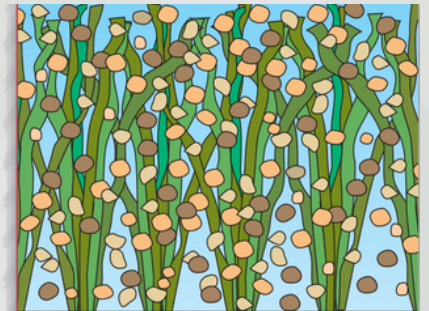

Contamination & compaction can lead to a flooding surface which can be **slippery and unsafe** for users.

Surface water remains longer & leaves behind dark silty patches once drained.

Using our compressed air **REJUVENATION** process all the contaminated infill is removed from the carpet.

The **fibres are decompacted & lifted** back to an upright position.

New **performance silica sports sand** is installed into the surface using specialist machinery to give an even distribution.

This results in a safe, clean and free-draining surface giving the potential for a further 3-5+ years of life (with recommended ongoing maintenance).

The **REPLAY REJUVENATION** process restores sand-filled & sand-dressed pitches to an 'as new' condition, in terms of safety, performance & drainage. This substantially increases the playing life of the surface for a fraction of the cost of a new carpet.

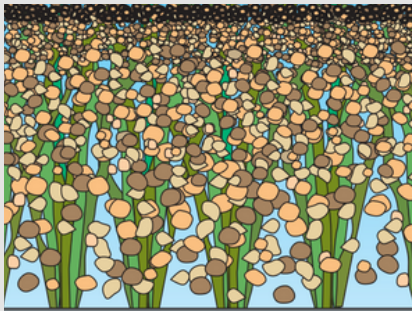

Through **Replay's free health check**, the synthetic surface is inspected & recommendations made.

Specialist machinery extracts contaminated infill and disposes of it.

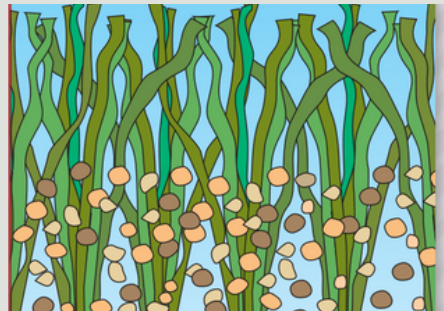

New infill is applied, this may look heavy on the surface but it will be 'bedded-in' through play and brushing.

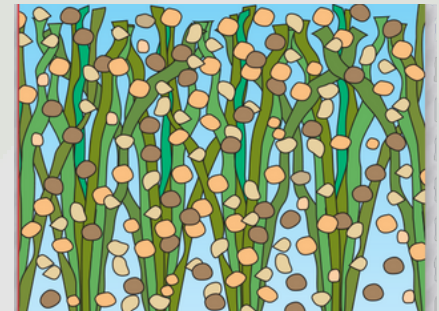

Contamination & compaction can lead to a flooding surface which can be **slippery and unsafe** for users.

Surface **water remains longer** and leaves behind **dark silty patches** once drained.

Using our compressed air **REJUVENATION** process all the contaminated infill is removed from the carpet.
