

Before

During

After

The **AQUATRAX®** is a unique process, combining pressure washing and vacuum extraction. The machine applies pressure water jets to dislodge the dirt. A vacuum extraction system then removes the dirty water to a tank on the machine so that contaminants are not returned to the surface.

### Your **AQUATRAX®** Package will include:

A first pass involving a 'pre-wet' phase.

A non-damaging cleaning phase with low-pressure, high-volume water jets.

An integrated vacuum removing the dirty water.

In most cases, two passes are sufficient to clean the surface, restore grip underfoot and improve performance.

The edges of tracks can be cleaned utilising a side arm attachment.

**AQUATRAX®** can also effectively clean track-side drainage systems. As only water is used, the waste can be discharged into a foul drain.

Slot drain cleaning and moss pre-treatment can be included as part of your **AQUATRAX®** package if required.
